

A Simple Article

Jane Smith

April 2026

1 Introduction

This is a simple article to test basic text extraction. The converter should correctly identify the title, author, date, section headings, and body paragraphs.

Each paragraph should be separated by a blank line in the Markdown output, and the text content should be character-perfect with no missing words or garbled output.

2 Background

PDF documents store text as positioned glyphs rather than flowing paragraphs. This means a converter must reconstruct the logical reading order from spatial coordinates. Our pipeline uses adaptive gap analysis to group glyphs into words, lines, and blocks.

3 Conclusion

If this document converts correctly, the basic extraction and assembly pipeline is working as expected. The key metrics are: no missing text, correct paragraph breaks, and proper section heading identification.
